Dear Traild team:

I'm interested in Traild because the role matches my strongest work: building cloud SaaS products that reduce operational risk, automate routine work, improve observability, and stay close to real business workflows.

At PaidRight, I improved ingestion, testability, observability, and delivery workflows for a GCP payroll compliance platform. At Daisee, I helped move a distributed AWS voice analytics platform from per-customer deployments to a multi-tenant architecture, lifting monthly change volume from about 10 to more than 300, increasing deployments from 4-8 to 50, and cutting AWS infrastructure cost by 70%. At Bunnings, I automated safety incident reporting, replacing manual report assembly with a live dashboard that let users inspect the incidents behind each number.

That same product-engineering thread attracts me to Traild: software that removes routine work, makes risk visible, and helps operational teams act with confidence. I bring senior engineering breadth across Python, SQL, TypeScript, Haskell, GCP, AWS, Kubernetes, Terraform, CI/CD, OpenTelemetry, and distributed systems. I also bring the judgment to turn messy operational systems into clear technical pathways, mentor engineers, and make teams faster without weakening control.

Regards,

Daniel
